1 Basics of statistics

The fundamental problem we face when dealing with many particles is not that we could not solve the equations of motion for all these particles in principle but that it is just not useful to attempt this. The sheer magnitude of equations you would need to solve would take any given period of time. However there are certain quantities that arise from the perceived chaos of the many particles which we can extract using statistics. These quantities emerge from a huge number of particles and do not carry meaning for a small number of particles.
